What is QUIC?

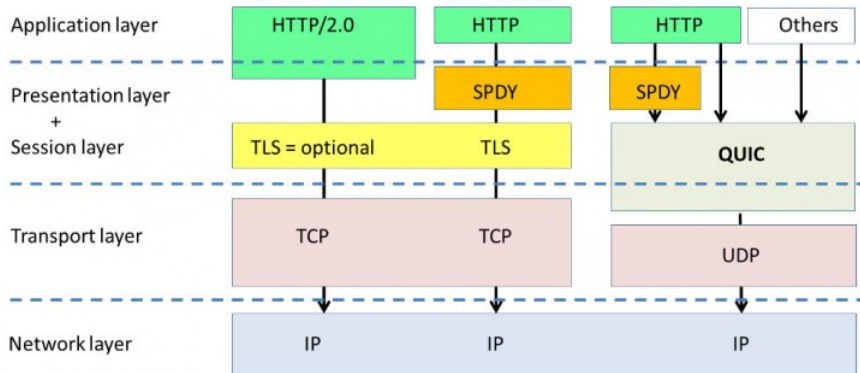

Figure 1: Network Stack

What is QUIC?

Zero RTT Connection Establishment

1. Repeat connection
2. Never talked to server before

Figure 2: RTT Times between TCP, TCP+TLS and QUIC

Goals

Analyze performance of TCP and QUIC in terms of:

- **Total transfer time**
- **Average Bandwidth used**
- **Overhead in bytes**

Experimental Setup

Figure 3: experimental setup used

- Chromium Project experimental QUIC Server - Chromium as client.
- Apache2 Webserver configured for TLS1.2 - wget as client.
- tc netem + tbf configuration of local loopback interface.
- Data captured with tcpdump, packet information stored.
- Packet data analyzed with Python library matplotlib.

Test Variables

- All possible combinations of Network Delay, Packet Loss and Available Bandwidth performed.
- All Network Jitter values tested with a set Delay of 60 ms and a Bandwidth of 100 Mbps.
- Sudden Bandwidth decrease tests to 10% of Available Bandwidth, for all Network Delay values with a bandwidth of 40Mbps.
- All tests performed five times, sudden bandwidth decrease tests performed ten times.

Table 1: Test variables.

Network Delay (ms)	10, 20, 40, 60, 80, 100, and 120
Network Jitter (ms)	0, 10, 20, 40 and 50
Packet loss (%)	0, 2.5 and 5
Available Bandwidth (Mbps)	1, 40 and 100

Results

Throughput Comparison: Delay 40 ms, Jitter 0 ms, Bandwidth 40 Mbps, PckLoss: 0.0%, with no spikes
QUIC: Duration Std. Deviation: 0.030 s, Bandwidth Std. Deviation: 0.000 Mbps
TCP: Duration Std. Deviation: 0.670 s, Bandwidth Std. Deviation: 0.150 Mbps

Figure 4: Time Series under favorable conditions

Results

Throughput Comparison: Delay 10 ms, Jitter 0 ms, Bandwidth 100 Mbps, PckLoss: 5.0%, with no spikes

QUIC: Duration Std. Deviation: 2.110 s, Bandwidth Std. Deviation: 0.020 Mbps

TCP: Duration Std. Deviation: 3.630 s, Bandwidth Std. Deviation: 0.010 Mbps

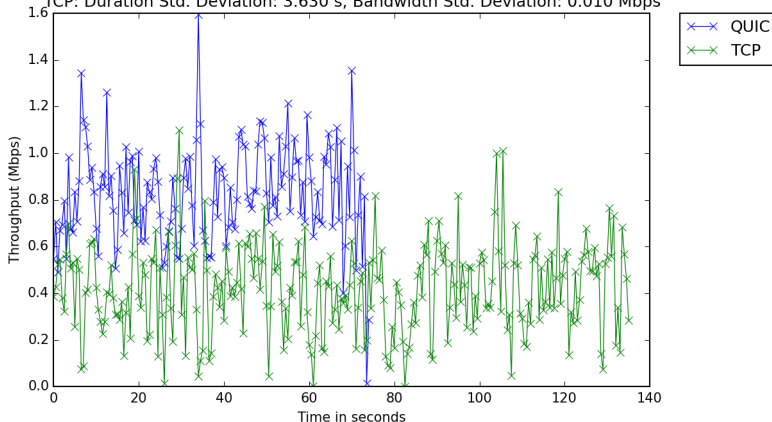

Figure 5: Time Series under heavy packet loss

Results

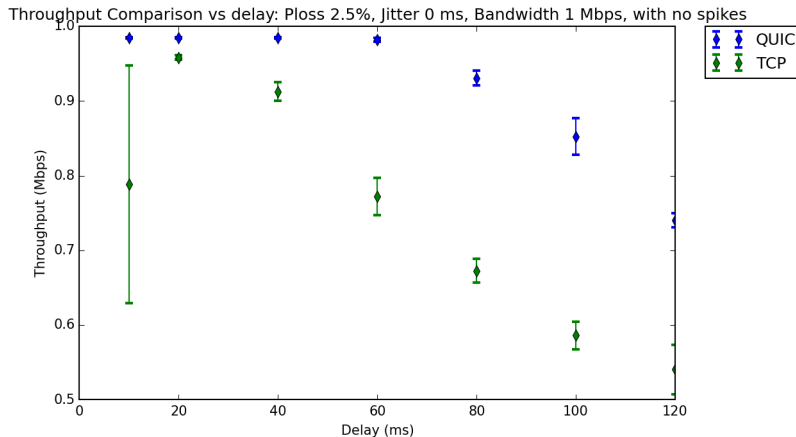

Figure 6: Throughput against Delay

Results

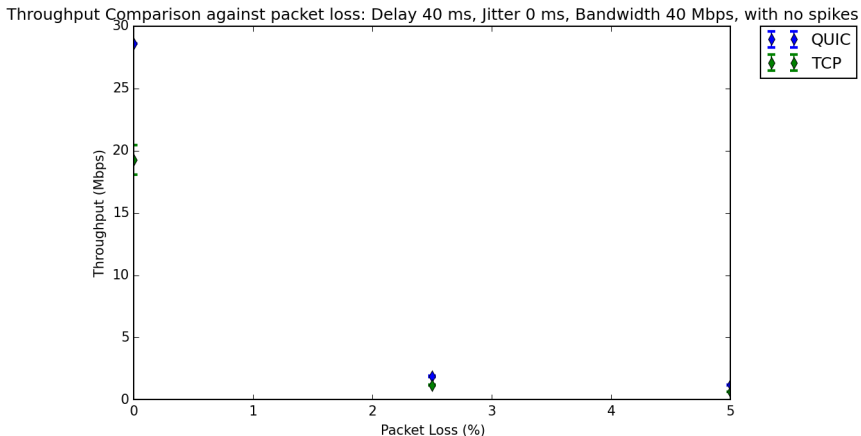

Figure 7: Throughput against Packet Loss

Results

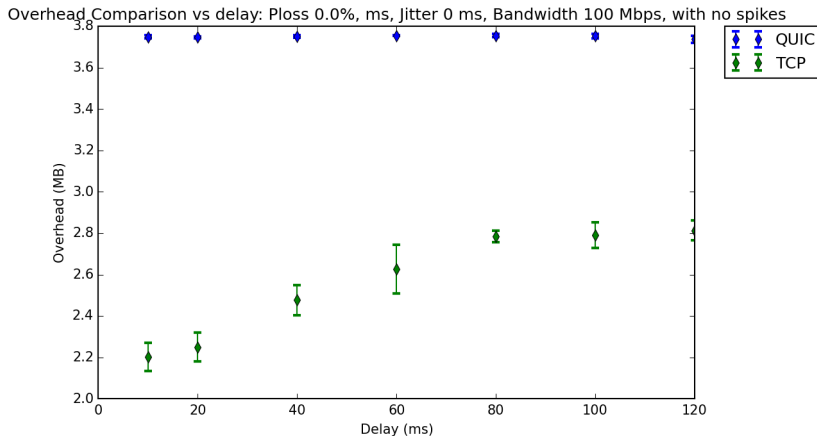

Figure 8: Overhead (in bytes) compared against Delay

Results

Throughput Comparison: Delay 120 ms, Variance 0 ms, Bandwidth 40 Mbps, PckLoss: 0.0%, with spikes

Figure 9: Bandwidth against a decrease in bandwidth

Results

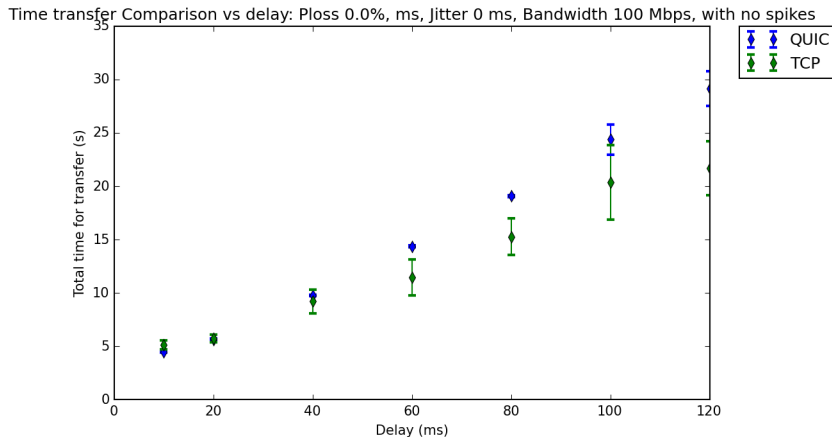

Figure 10: Throughput against Delay

Results

Throughput Comparison: Delay 100 ms, Jitter 0 ms, Bandwidth 100 Mbps, PckLoss: 0.0%, with no spikes

QUIC: Duration Std. Deviation: 1.420 s, Bandwidth Std. Deviation: 0.080 Mbps

TCP: Duration Std. Deviation: 3.490 s, Bandwidth Std. Deviation: 0.320 Mbps

Conclusions

- At the cost of higher overhead, QUIC outperforms TCP under favorable conditions in terms of time for transfer and average bandwidth used.
- Under packet loss, QUIC also surpasses TCP
- QUIC recovers more quickly from drops in bandwidth
- With high delays and jitter, QUIC hits a bandwidth threshold and TCP performs better. Causes might lie in current release and not in the protocol itself.

Future work centered in:

- Repeating this test suite with future and final versions of QUIC to compare performance upgrades
- Designing new tests to measure fairness when sharing bandwidth with other QUIC/TCP flows
- Stream Multiplexing in QUIC: Evaluate advantages over loading HTTP pages, for example.
- FEC (Forward Error Correction): Benefits of using FEC in packet loss scenarios.
